Title : The Therapeutic Effect of Dehydrochloramphenicol in Mycolic Diseases

Orig Pub : Univ. Carolina. Med., 1955, Suppl. No 1, 445-449

Abstract : The local application of dehydrochloramphenicol in skin mycoses, in the form of a 2-3 percent solution in a mixture of glycerine and alcohol, in the proportions of 1:4, produced good results in 79 percent of all the cases. The preparation is well tolerated, is odorless and non-irritating.

Title : Candida Albicans and Chlorpromazine

Orig Pub. : Goskosl. dermatol., 1957, 32, No 1, 19-21

Abstract : The effect of chlorpromazine was studied on seven pathogenous strains of *Candida albicans* isolated from the affected areas of the skin and mucous membranes of man. A suspension was prepared, in physiological solution, containing 2.6 million yeast cells in 1 ml. and acted upon with different concentrations of chlorpromazine (from 2.5% and below). It was established that chlorpromazine is effective against *Candida albicans* in a concentration of 0.4 mg./ml.-- V. V. Vladavets

SOURCE: Ceskoslovenska fysiologie, v. 14, no. 4, 270

TOPIC TAGS: drug effect, hemoglobin, oxygen, animal physiology

ABSTRACT: The level of physically dissolved O<sub>2</sub> released from oxyhemoglobin into interstitial tissue fluid and as yet not taken up by cells is very susceptible to various changes of internal environment; epinephrine, anesthesia, decreased oxygen concentration in inspired air all lower it. The level rapidly stabilizes in a direct ratio to the level in inspired air. [JPRS]

"Partial Pressure of Oxygen in Tissues and its Role in Radio-  
protection of Amines and Thiols."

Prague, Ceskoslovenska Fysiologie, Vol 15, No 2, Feb 66, pp 72-80

Abstract: Partial pressure of oxygen in tissues protected by  
mexamine, serotonin and cystamine was investigated. Mexamine  
and serotonin decrease partial pressure of oxygen, cystamine does  
not change it. It appears that the high protection given by  
indole-alkylamines (serotonin and mexamine) is due to tissue  
hypoxia. 1 Western, 1 Czech, 3 Russian references. Submitted  
at "16 Days of Physiology" at Kosice, 27 Sep 65.

Aliphatic branched-chain hydrocarbons II Stanbury  
Landa, J. and Vacek, J. *Chem. Listy* 18, 974-975 (1964) 48, 1032  
branched-chain paraffins were prepared by the hydrogenation  
of alkenes obtained by the hydrogenation of alcohols or glycols.  
The hydroxy compounds were prepared by the Grignard synthesis  
from the esters of undecylenic, glutaric, and pimelic acids.  
Dehydration was carried out by heating the hydroxy  
compounds 6 hrs. at 160-170° with anhydrous  $\text{CuSO}_4$ , or by heating  
8 hrs. at 140-170° with anhydrous  $\text{CaH}_2$ , or with  $\text{O}_2$   
 $\text{C}_2\text{H}_5\text{CO}_2\text{H}$  at 160-170°. Some alkenes were prepared by the  
dehydrohalogenation of the corresponding halides by heating  
with  $\text{CaH}_2\text{N}$ . Hydrogenation of the alkenes over  $\text{PtO}_2$  gave  
the paraffins; the unreacted unsaturated hydrocarbons being removed  
by  $\text{KMnO}_4$  oxidation. The following hydroxy compounds  
were prepared: (1) yield in %, m.p. and b.p. given. 3,7-diethyl-  
nonan-3,7-diol, 33, 68°, b.p. 161.2°. 4,8-dipropyldodecan-  
4,8-diol, 20, 97°. 11-ethyl-1-tridecan-11-ol, 58.8, —,  
b.p. 191°. 3,6-diethylundecan-3,6-diol, 16, 86.2°, —, 11-  
propyl-1-tridecan-11-ol, 19.5, —, b.p. 191°. 1,11-dipropyldodecan-  
1,10-diol, 30, —, b.p. 191°. 3,6-dibutyldodecan-3,6-diol, 10,  
—, b.p. 191°. 1,11-dibutylpentadecan-1,10-diol, 34.6, 43.5°, —,  
11-octyl-1-nonadecan-11-ol, 39, 39-40.5°, b.p.  
193°. 6,12-dimethylpentadecan-6,12-diol, 30, 61.2°, —.  
The following alkenes were formed (b.p. in °C,  $\eta_{\text{inh}}$  in  $\text{cm}^3/\text{g}$  in  $\text{C}_6\text{H}_6$ ):  
undecene (points of unsaturation uncertain), b.p. 125°,  $\eta_{\text{inh}}$  1.70, 1.48-1.52.  
1,11-dodecadiene, b.p.

[illegible]

VACEK, J.

The determination of the decomposition of procaine and interaine by paper chromatography and the local anesthetic effect of decomposed procaine solutions. J. Vacek et al. (State Inst. Control Med., Prague). *Československá Farm.* 2, 183-90 (1953).—p-Aminobenzoic acid (I), the hydrolysis product of procaine, and p-benzylaminobenzoic acid (II), the hydrolysis product of interaine (tetraaine), were separated by use of ascending chromatography. Solvents used were as follows: soln. of procaine: Et-BaOH-30% HCl-H<sub>2</sub>O (10:15:15); soln. of interaine: MeOH-AmOH-benzene-4% NH<sub>4</sub>OH (35:17.5:35:12.5). I was detected by spraying with a soln. of 0.2 g. NaNO<sub>2</sub> in 20 ml. H<sub>2</sub>O and 2 ml. AcOH and with a soln. of 0.2 g. 1-naphthol in 20 ml. 60% EtOH and 4 ml. NH<sub>4</sub>OH. II was detected after spraying with a-naphthoflavone (0.1% soln. in EtOH) in ultraviolet light. The area of spots depends on concn. which thus permits the estm. of the extent of decompn. with a precision  $\pm 10\%$ . The local anesthetic activity of I diminishes with increasing decompn. D. Hublková

*Chem*  
 Colorimetric determination and paper chromatography of the calcium salt of *N*-benzoyl-*p*-aminosalicylic acid. J. Vacek and M. Lašková (Stát. ústav. kontrolu léčiv, Prague). *Českoslov. farm.* 5, 75-7 (1950).—The content of the Ca salt of *N*-benzoyl-*p*-aminosalicylic acid (I) in Benzacyl-Wander was detd. colorimetrically, the presence of impurities (*p*-aminosalicylic acid (II) and *m*-aminophenol (III)) by paper chromatography. Shake 0.17 g. finely powd. tablets 30 min. with 100 ml. 65% EtOH, then dil. to 600 ml. with water and filter. To 4 ml. of this soln. add 15 ml. water, 2 ml. 1% Fe(NO<sub>3</sub>)<sub>3</sub> in 1% HNO<sub>3</sub>, and water to 25 ml. Measure the violet color by using Pulfrich spectrophotometer and filter S 53. The method is accurate to within 2%. For semiquant. paper chromatography of 0.5-5  $\gamma$  II or III in 200-250  $\gamma$  I the following system proved the best: pyridine, BuOH, satd. NaCl soln., and 25% NH<sub>3</sub> soln. (6:6:5.3); *R<sub>f</sub>* for I 0.58, II 0.28, and III 0.78 were found. K. M.

Estimation of pentaerythritol tetranitrate in the presence of cyclotrimethylene trinitroamine. [M] Stanek and Jiri Vacek. *Chem. průmysl* 8(33), 361-6 (1958). Pentaerythritol tetranitrate (I) and cyclotrimethylene trinitroamine (II) can be detd. simultaneously by the following method: Dissolve a sample contg. not more than 0.22 g. of I and 0.12 g. of II in 30 ml. of glacial AcOH and add 25 ml. of 25% HCl. Remove air by passing a stream of  $\text{CO}_2$  through the soln. Add 50 ml. of 0.7N  $\text{FeCl}_3$  and reflux for 20 min. Cool, add 10 ml. of 10%  $\text{NH}_4\text{CNS}$ , and titrate with 0.2N  $\text{TiCl}_3$  until the red color disappears. Then add 20 ml. of N and titrate with 25 ml. of 0.25N  $\text{FeNH}_4(\text{SO}_4)_2$  until the red color persists for 1 min. Blanks have to be detd. and their values subtracted. The amt. of I is equiv. to the cor. vol. of  $\text{TiCl}_3$ , that of II to the cor. vol. of  $\text{FeNH}_4(\text{SO}_4)_2$ . Max Hellmann.

"Fourth National Pharmaceutical Congress of the Pharmaceutical Section at the J.Ev. Purkyně Czechoslovak Medical Society held in Gottwaldov."

Prague, Ceskoslovenska Farmacie, Vol XII, no 7, September 63, pp 375-380.

Abstract: The Congress was held in Gottwaldov, 20 to 22 May 1963. Stability of drugs was the main topic. It was attended by 340 Czechoslovak pharmacy specialists and representatives from Poland and Hungary. The report contains abstracts of lectures delivered. They deal with the production of drugs and its economic aspects, preparation of medicines in pharmacies, preservation of pharmaceutical preparations, and drugs control. The Congress adopted recommendations concerning various aspects of drugs, including the third edition of the Czechoslovak Pharmacopoeia. Authors and titles of the individual papers are given.

"Long-Term Follow-Up of Psychopathological Dynamics in a Case of Tuberous Sclerosis."

Prague, Ceskoslovenska Psychiatrie, Vol 63, No 1, Feb 67, pp 49-52

Abstract [Author's English summary modified]: A case of tuberous sclerosis verified in 3 generations in a family with different degrees of manifestation is discussed. A 6 year period of the study of a patient is described; the development of the disturbances of affectivity and emotionality was independent on the observed fits of periventricular epilepsy and singular cataplectic fits. A deepening of the apathetic-abulic syndrome was observed, accompanied by a colorful subjective neurotic symptoms. 2 Western references. (Manuscript received 14 Sep 65).

\* Production and properties of dense bodies made from tungsten carbide. Curt Agte and Jiri Vacek (Vedkumaf  
~~envy pro Frankford met., Prague). Metals 21(1) 8, 230-~~  
~~52(1953).~~—The authors studied possibilities of making  
sintered products from pure WC, WC + TaC 10%, and  
WC + TiC 10% and claim satisfactory results without the  
use of expensive Co. With pure WC highest hardness and d.  
were obtained when the carbide was ground for 120 hrs. in a  
ball mill (resulting in a particle size 0.8–1.2  $\mu$ ), mixed then  
with filtered beeswax 1 wt. % (used as a binder), dried at  
85°, subjected to a pressure of 3 tons/sq. cm., and sintered.  
The sintering was carried out in H first at 1000° and then  
at 1700° for 2 hrs. Rockwell hardness (I) of the product  
was 91–4 kg./sq. mm. and d. was 15.1. Similar procedure  
was used for WC + TiC 10% except that for highest I =  
93.2, highest d. = 12.52, and lowest elec. resistance (II) =  
0.311 ohm-sq. mm./m. The mixt. was sintered at 1800° for  
2 hrs. Similar procedure, for WC + TaC 10% resulted in a  
product with I = 91.2 (when ground, however, for only 24  
hrs. I was 98.0), d. = 14.9 (highest value), and II = 0.230  
(with 0.5% beeswax, II of the product = 0.235).

27 15  
 / The savings of cobalt when employing cermet carbides.  
 Curt Agie and Jifi Vacek. *Pokroky průzkum. mcl., Sborník  
 konf., Brno 1953, 443-50 (Pub. 1954).*—Numerous examples  
 are presented for high-speed steels and similar applications, in  
 which Co is replaced in part or in toto by carbides prepd. by  
 the aid of powder metallurgy. Thus certain hard wires can  
 be made up of WC with 6-25% iron; hard solders can be  
 made up of WC with small addns. of Co, Ni, and (or) Fe;  
 other hard alloys contain WC 64 + WTiC<sub>2</sub> 30 + Co 6%, or  
 TiC 18 + WC 78 + Fe-Cr 8%. WC can be completely ab-  
 sent, thus a very hard alloy contains TiC 45 + VC 45 + Ni  
 10%. The m.ps. of such alloys are very high; TiC 40 +  
 Mo<sub>2</sub>C 40 + TaC 10 + Ni 10% m. 1590-1650°. W.J.—
